

“SuperNova MKII Is Quite Simply The Most Amazing Subwoofer I’ve Ever Tested.”

“As its company boasts, the Earthquake SuperNova MK II subwoofer produces extremely high SPL (volume) levels in any size room. In fact, we were quite surprised with the volume levels the woofer reached, given its small enclosure.”

“...with an Xmax of 18.7mm, this woofer has three to four times the average subwoofer's excursion. There are too many positives to list about the actual transducer itself, ... I'll just say it's built very well.”

“...the sub integrated into my system quite well. I was delightfully surprised at the sonic presence and transparency of the SuperNova, as it delivered tight, accurate bass even at very low volume levels.”

“The experience was like watching this movie for the first time. I found myself gripping the couch nervously during the more “explosive” scenes.”

“This component, in its entirety, is well thought out, and built even better. To put it plainly, the Earthquake SuperNova MKII is quite simply the most amazing subwoofer I've ever tested.”
